

**SECTION 2.18 POTENTIAL FOR FUTURE ACTIVITIES AT SITE**  
**(WAC 463-42-295)**

All activities planned at the proposed facilities are included in this application, including some construction which may or may not occur in the future. Construction activities which will not occur as part of the initial project construction, but which are included in this proposal, are as follows:

- C The Stampede, Beverly-Burke, and Othello Pump Stations will be constructed when fuel volumes increase in the future.
  
- C Only six of the ten storage tanks proposed at the Kittitas Terminal will be built in the initial construction phase; the remaining four tanks will be built on demand in the future.

Upon project completion and commencement of operation, OPL as the pipeline operator may be approached by a third party to provide product transportation and delivery to a third party storage facility. At present OPL is unaware of any plans to construct such a facility at any location along the proposed pipeline route. Construction modifications to the pipeline may include installation of valves and a metering facility at the delivery point, and would be subject to EFSEC approval.
