Subject: Comment on Docket No. EF-131590, Application No. 2013-01

Dec 17, 2013

Mr. Stephen Posner
P.O. Box 43172
Olympia, WA 98504-3172

Dear Mr. Posner,

I'm writing regarding Docket No. EF-131590, Application No. 2013-01 to urge the Washington Energy Facility Site Evaluation Council (EFSEC) to assess the full environmental and public safety impact of the joint Tesoro-Savage proposal to turn the Port of Vancouver into a major crude oil export terminal.

If approved, the plan would result in 380,000 barrels of oil each day being shipped through Spokane, the Columbia River Gorge National Scenic Area, Vancouver and other Northwest communities. Oil-by-rail is a bad deal for Washington State. The project comes at a steep price for rail communities and the Columbia River, yet offers few jobs in return. Based on the far reaching impacts of this project, I urge you to recommend the rejection of Tesoro-Savage's proposal.

The public safety and environmental impacts of this proposal deserve close scrutiny. For example, EFSEC must assess:

1) The potential safety and environmental impacts of a large train-related oil spill or explosion along the rail route in Washington and beyond. Recent derailment disasters in Lac-Mégantic, Quebec and Alabama have shown that these risks are far too real. The tragedy in Quebec, in particular, highlighted the extreme danger of the same type of oil and tankers that would be traveling through our communities.

Forty-seven people died in that explosion, which also devastated the town.

2) The increased risk of an oil tanker spill on Washington State waters and along the shipping route.

3) The transportation and public health impacts of additional unit train traffic through communities along the proposed oil-by-rail route.

This includes evaluating emergency response capabilities in Vancouver, where oil trains would deliver and store oil, and other communities along the rail and shipping route.

4) The project's impact on climate change. This analysis should include climate change impacts from crude oil as well as tar sands oil from cradle to grave.

5) The impact of the project's cradle-to-grave CO2 emissions on the viability of the large oyster industry in Washington State.

After carefully considering the safety, environmental, and climate risks associated with the proposed oil terminal, I respectfully ask you to recommend the rejection of Tesoro-Savage's application.

Sincerely,

Ms. Heidi Madden

This includes evaluating emergency response capabilities in Vancouver, where oil trains would deliver and store oil, and other communities along the rail and shipping route.
- 4) The project's impact on climate change. This analysis should include climate change impacts from crude oil as well as tar sands oil from cradle to grave.
- 5) The impact of the project's cradle-to-grave CO2 emissions on the viability of the large oyster industry in Washington State.

After carefully considering the safety, environmental, and climate risks associated with the proposed oil terminal, I respectfully ask you to recommend the rejection of Tesoro-Savage's application.

Sincerely,

Dr. Rik Smith

Subject: Comment on Docket No. EF-131590, Application No. 2013-01

Dec 17, 2013

Mr. Stephen Posner
P.O. Box 43172
Olympia, WA 98504-3172

Dear Mr. Posner,

I'm writing regarding Docket No. EF-131590, Application No. 2013-01 to urge the Washington Energy Facility Site Evaluation Council (EFSEC) to assess the full environmental and public safety impact of the joint Tesoro-Savage proposal to turn the Port of Vancouver into a major crude oil export terminal.

If approved, the plan would result in 380,000 barrels of oil each day being shipped through Spokane, the Columbia River Gorge National Scenic Area, Vancouver and other Northwest communities. Oil-by-rail is a bad deal for Washington State. The project comes at a steep price for rail communities and the Columbia River, yet offers few jobs in return. Based on the far reaching impacts of this project, I urge you to recommend the rejection of Tesoro-Savage's proposal.

The public safety and environmental impacts of this proposal deserve close scrutiny. For example, EFSEC must assess:

- 1) The potential safety and environmental impacts of a large train-related oil spill or explosion along the rail route in Washington and beyond. Recent derailment disasters in Lac-Mégantic, Quebec and Alabama have shown that these risks are far too real. The tragedy in Quebec, in particular, highlighted the extreme danger of the same type of oil and tankers that would be traveling through our communities. Forty-seven people died in that explosion, which also devastated the town.
- 2) The increased risk of an oil tanker spill on Washington State waters and along the shipping route.
- 3) The transportation and public health impacts of additional unit train traffic through communities along the proposed oil-by-rail route. This includes evaluating emergency response capabilities in Vancouver, where oil trains would deliver and store oil, and other communities along the rail and shipping route.
- 4) The project's impact on climate change. This analysis should include climate change impacts from crude oil as well as tar sands oil from cradle to grave.
- 5) The impact of the project's cradle-to-grave CO2 emissions on the viability of the large oyster industry in Washington State.

After carefully considering the safety, environmental, and climate risks associated with the proposed oil terminal, I respectfully ask you to recommend the rejection of Tesoro-Savage's application.

Sincerely,

Mr. Michael Brown

Subject: EIS Scoping comments for Tesoro Savage proposal in Vancouver

Dear

Dear Distinguished Environmentalists:

Energy independence is not exporting carbon based energy commodities. Energy independence is supplying your citizens with non imported energy commodity from a source other than non- economically friendly nation supply chains—petroleum imports. Tar sands, coal train, and fracking are our choices for energy production expansion and energy independence. These choices are not ecological. They are economically expansive for American Wall Street investment and free from non-friendly foreign entanglement.

Petroleum jobs begin with a concentration of labor focused at a digging or drilling site, often a natural site. These are often temporary jobs. These workers require a social living arrangement for short term living condition. Many will leave after the sighting is complete. Many are locals many are not. The setup up and removal of mining for these products creates an added waste stream from short term living spaces or temporary homes, often mobile or akin to the FEMA emergency homes. (These are often short term usage homes of a less than permanent design; a waste stream creation in comparison to 'longer life' foundation homes.)

Carbon energy waste stream continues as the mining, processing and shipping of these one-time carbon based energy sources create a multitude of wastes; waste 'tar' sand (after the tar is removed) or tar sand water or fracking water pools or coal dust from coal train shipping process. One time petroleum based wastes, not created producing solar.

Solar energy maybe best installed on urban rooftops. There is no comparable carbon sourced energy production impact to the land by sighting solar. Urban rooftops are wired to the grid, and the inefficiency of the global electrical generation supply and usage pattern today, is 43%. Solar rooftop electric generation greatly reduces lost electric power from transmission.

Solar on an urban homeowner's roof means greater efficiency. Solar on a roof means local urban jobs. (Local urban solar installation means more urban construction jobs from the young growing source of solar installation labor. The young source of labor will want homes, foreclosed homes in need of maintenance.) Solar removes the carbon from the energy supply chain. Solar increased efficiency and Solar manufacturing isolates the production to a single industrial space. Carbon based energy production fails badly as petroleum production means digging up the lands and moving labor all over the country.

Raising the gasoline tax and placing the tax revenue into solar FiT (Feed in Tariffs) and PPAs(Power Purchase Agreements) will stimulate urban jobs if the subsidies focus upon solar home owner purchases. Corporate and utility solar have opportunity for solar profits via the PEIS (Programmatic Environmental Impact Statement) a legal definition for sighting solar on 384,000 acres of land in six southwestern states, created by the BLM/DOE (Bureau of Land Management & the Department of Energy.) Virginal publicland for solar sighting, zoned for corporate sighting, and designed for corporate profits. This is land that will be forever disturbed by the industry. Solar installation on urban roofs is about a third more expensive than PEIS defined corporate solar installation. To perfect ecological market expansion and cost reduction for solar urban installation market subsidies might be increased into this direction. Pay now to perfect urban rooftop solar installation and save virginal lands is opportune.

Germany installs solar on rooftops at about a third the cost of US installations. Germany has 'fast tracked' the legal/code/subsidy processes, naturally allowing market expansion to improve the efficiency of the solar supply chain development. Increased solar market influence will improve the solar sector production and sighting efficiencies to further reduce solar costs. With governmental subsidy increase profits by urban users will be created to promote

economics of scale for the solar supply chain—costs reduced via increased solar subsidy. Demand for solar reduces carbon release and creates jobs, local urban jobs, long term construction oriented jobs.

Sincerely,

Donald T. Coughlin
