I believe that the EIS should include, but not limited to:

1. Life-cycle cost per KWH of the complete installation including solar panels, battery storage system, collector substation, transmission lines, two switch yard, operation and maintenance building, and perimeter fencing.
2. Projected continuous 24/7 power output during winter months.
3. Comparison of costs and output of other power generation systems.
4. Habitat mitigation measures.
5. Visual mitigation measures.
6. End-of-life waste. How much will be recycled? How much will be hazardous waste? How will the hazardous waste be disposed?
